## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

### Section 1 : Coding

#### 1. Problem Statement

A shopkeeper is recording the daily sales of an item for N days, where the price of the item remains the same for all days. Write a program to calculate the total sales for each day and save them in a file named sales.txt that can store the data for a maximum of 30 days. Then, read the file and display the total earnings for each day.

Note: Total Earnings for each day = Number of Items sold in that day × Price of the item.

#### ***Input Format***

The first line of input consists of an integer N, representing the number of days.

The second line of input consists of N space-separated integers representing the

number of items sold each day.

The third line of input consists of an integer M, representing the price of the item that is common for all N days.

### ***Output Format***

If the number of days entered exceeds 30 ( $N > 30$ ), the output prints "Exceeding limit!" and terminates.

Otherwise, the code reads the contents of the file and displays the total earnings for each day on separate lines.

Contents of the file: The total earnings for N days, with each day's earnings appearing on a separate line.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 4  
5 10 5 0  
20  
Output: 100  
200  
100  
0

### ***Answer***

```
# You are using Python
with open("sales.txt","w") as file:
    a=int(input())
    num = list(map(int,input().split()))
    price=int(input())
    for i in range(a):
        if a>30:
            print("Exceeding limit!")
            break
```

```
else:  
    print(num[i]*price)
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

In the enchanted realm of Academia, you, the Academic Alchemist, are bestowed with a magical quill and a parchment to weave the grades of aspiring students into a tapestry of academic brilliance.

The mission is to craft a Python program that empowers faculty members to enter student grades for any two subjects, stores these magical grades in a mystical file, and then, with a wave of your virtual wand, calculates the GPA to unveil the true essence of academic achievement.

### ***Input Format***

The input format is a string representing the student's name, any two subjects, and corresponding grades.

After entering grades, they can type 'done' when prompted for the student's name.

### ***Output Format***

The output should display the (average of grades) calculated GPA with a precision of two decimal places.

The magical grades will be saved in a mystical file named "magical\_grades.txt".

Refer to the sample output for format specifications.

### ***Sample Test Case***

Input: Alice  
Math  
95  
English

```
88
done
Output: 91.50
```

### **Answer**

```
with open("magical_grades.txt", "w") as file:
    while True:
        name = input()
        if name.lower() == "done":
            break

        subject1 = input()
        grade1 = float(input())
        subject2 = input()
        grade2 = float(input())

        # Write the student info to the file
        file.write(f"{name} {subject1} {grade1} {subject2} {grade2}\n")

        # Calculate and print GPA
        gpa = (grade1 + grade2) / 2
        print(f"{gpa:.2f}")
```

**Status :** Correct

**Marks : 10/10**

### **3. Problem Statement**

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted\_names.txt.

### **Input Format**

The input consists of multiple lines, each containing a name represented as a string.

To end the input and proceed with sorting, the user can enter 'q'.

### **Output Format**

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: Alice Smith

John Doe

Emma Johnson

q

Output: Alice Smith

Emma Johnson

John Doe

### **Answer**

# You are using Python

with open("sorted\_names.txt","w") as file:

result=[]

while True:

data=input()

if data.lower()!='q':

result.append(data)

else:

break

so=sorted(result)

ff=list(so)

for i in ff:

print(i)

**Status : Correct**

**Marks : 10/10**

## **4. Problem Statement**

Bob, a data analyst, requires a program to automate the process of analyzing character frequency in a given text. This program should allow the user to input a string, calculate the frequency of each character within

the text, save these character frequencies to a file named "char\_frequency.txt," and display the results.

### ***Input Format***

The input consists of the string.

### ***Output Format***

The first line prints "Character Frequencies:".

The following lines print the character frequency in the format: "X: Y" where X is the character and Y is the count.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: aaabbbccc

Output: Character Frequencies:

a: 3

b: 3

c: 3

### ***Answer***

```
# You are using Python  
with open("char_frequency.txt","w") as file:
```

```
    lii=input()
```

```
    d={}
```

```
    print("Character Frequencies:")
```

```
    for i in lii:
```

```
        d[i]=d.get(i,0)+1
```

```
    for k,v in d.items():
```

```
        print(k+":",v)
```

**Status :** Correct

**Marks :** 10/10
